Newark, DE 19711

RE: Report on source water protection in the City of Newark, New Castle County, Delaware

Dear Mr. Simonson:

Enclosed is our report summarizing the natural resources that may be protected by Newark’s municipal code for areas upstream of the drinking water intakes on the White Clay/Red Clay Creeks above Stanton and on the Christina River at Smalley’s Pond.

Should you have any questions, please do not hesitate to contact our office at 302-831-4932.

Warmly;

Andrew Homsey       Gerald Kauffman
Summary

This report summarizes the natural resources protected by the City of Newark’s municipal code in the source waters (Levels 1A, 1B, and 2) upstream from the drinking water intakes along the White Clay/Red Clay Creeks above Stanton and the Christina River at Smalley’s Pond. This GIS analysis tabulates the area already protected by code as part of Newark’s approach to meet the Delaware Source Water Protection Law of 2001.

Level 1A areas are defined as 100-year floodplains and/or erosion-prone slopes, and Level 1B areas as buffer areas 200 feet from each side of streams. For the purposes of this study Level 2 areas are areas of the watersheds which lie within the corporate limits of Newark.

Approach

The purpose of this GIS analysis is both to assess land use within Newark and its protected areas, and to quantify the amount of protected natural areas which lie in Level 1A, Level 1B, and Level 2 source water areas.

Land use/land cover information in Newark was summarized using the following categories:
- Single Family Residential
- Multi-Family Residential
- Mobile Home Parks
- Retail
- Other Commercial
- Industrial
- Transportation/Communication
- Utilities
- Urban/Built-up
- Institutional/Government
- Recreational
- Agricultural
- Forest
- Wetlands
- Water
- Extraction
- Transition

Those areas of natural resources protected by Article 10 of the New Castle County Unified Development Code and used in this analysis, as well as certain other, sensitive areas, are specified in the following list:
- Class A Wellheads
- Class B Wellheads
- Class C Wellheads
- Recharge Area Water Resource Protection Area (WRPA)
- Erosion Prone Slopes
- Steep Slopes (slopes $\geq 15\%$ and $< 25\%$)
- Steep Slopes (slopes $\geq 25\%$)
- Forests (as designated by DNREC’s Green Infrastructure program)
- Floodplain (100 year floodplain)
- Wetlands (as designated by DNREC)
- Riparian Buffer (50 ft. from floodplains and wetlands, 100 ft. from streams)
- Public/Private Open Space
- Newark Reservoir WRPA

Results

Table 1 summarizes the land use classes found both within Level 1A only, Level 1B only, either Level 1A or Level 1B (i.e. all Level 1 areas), and Level 2 areas in Newark. Since Level 1A and 1B areas overlap in places, the area of Level 1 is less than the sum of the areas of Levels 1A and 1B. Note that Level 2 areas are conterminous with the corporate boundary of Newark, since by definition, Level 2 areas comprise all land upstream from drinking water intakes.

</table>

Table 3 shows the areas of each of the specified natural resources within the Level 1B buffer in Newark, and indicates the percentage of land within this zone protected, or potentially protected, by code. Since many of these layers may overlap, both the total areas, including those that overlap, as well as the exclusive areas, are shown. Since the Level 1A zones are, by definition, identical to the combination of the floodplain and erosion-prone slopes as specified in the UDC, the areas of Level 1A zones are not enumerated by type. The fact that they are identical is indicated by the fact that in the table, they are listed as being protected 100%. The final row of the table indicates the aggregate protection afforded by the specified protection layers within all Level 1 (Level 1A plus Level 1B) areas.

Table 4 summarizes the land uses in Newark based on the following generalized classes:

- Built—areas which are already developed,
- Unbuilt—areas such as vacant or transitional lands which may be developed in the near future, or areas in a land use not currently developed, such as agriculture. Includes areas of natural lands, such as forestland, wetlands, parks, etc.

The “Built” class includes the following land use categories based on the 2002 state-wide land use data: Single Family Residential, Multi-Family Residential, Mobile Home Parks, Retail, Other Commercial, Industrial, Transportation/Communication, Utilities, Urban/Built-up, and Institutional/Governmental.

The “Unbuilt” class includes: Extraction and Transition, Agricultural, Recreational, Forestland, Wetlands, and Water.

The land in each category is subdivided into those areas which contain significant natural resources, as defined in Table 3, and those which do not. Those areas which contain significant natural resources are designated “Protected”, while those that do not are designated “Not Protected”.

<table>
<thead>
